Actors: Customer, Bank Employee, Loan Officer, Bank Manager, System Admin, Auditor

Issue #	Type	Story Name / Description	Priority	Story Points	Acceptance Criteria	Rationale
#1	Functional	**Use authentication and Login:** Users should be able to authenticate and log in using valid credentials.	High	3	Pass: Valid credentials allow login and invalid credentials are rejected. Fail: Login succeeds with incorrect credentials or authentication is bypassed.	Authentication prevents unauthorized users from accessing the banking system.
#2	Functional	**Role-Based Access Control:** The system should enforce role-based access so users can access only functions permitted for their role.	High	5	Pass: Each role can access only its permitted functions and data. Fail: A user can access restricted functions or another role's data.	Different banking roles require different permissions to protect sensitive operations.
#3	Functional	**Account & Balance Management:** Customers should be able to view their account details and current balance.	High	3	Pass: Correct account details and current balance are displayed after login. Fail: Incorrect or outdated account information is shown.	Customers need accurate account information to manage their money.
#4	Functional	**Deposit Money:** Customers should be able to deposit money into their account, with the balance updated immediately.	High	3	Pass: Deposit is recorded, balance increases correctly, and confirmation is shown. Fail: Deposit is missing, duplicated, or the balance is incorrect.	Deposits are a core banking operation and must be recorded accurately.
#5	Functional	**Withdraw Money:** Customers should be able to withdraw money from their account when sufficient funds are available.	High	3	Pass: Withdrawal is recorded, balance decreases correctly, and confirmation is shown. Fail: Withdrawal exceeds available funds or the balance is incorrect.	Withdrawals directly affect customer funds and require accurate validation.
#6	Functional	**Transaction Validation & Recording:** The system should validate transactions and record each successful transaction with the correct details.	High	5	Pass: Valid transactions are accepted and recorded with amount, type, account, and date. Fail: Invalid transactions are recorded or transaction details are incorrect.	Validation and accurate records are necessary for reliable banking operations and auditing.
#7	Functional	**Fund Transfer Between Accounts:** Customers should be able to transfer funds between eligible accounts within the bank.	High	5	Pass: Transfer completes and sender and receiver balances update correctly. Fail: Money leaves one account without reaching the other.	Internal transfers are a core banking function and must move funds accurately.
#8	Functional	**Atomic Transfer & Rollback:** The system should process fund transfers atomically and roll back the transaction if any part of the transfer fails.	High	8	Pass: Both account updates succeed together, or neither update is retained after failure. Fail: Only one account is updated after a failed transfer.	Atomic processing prevents partial transfers and protects customer balances.
#9	Functional	**Loan Application:** Customers should be able to submit loan applications through the banking system.	Medium	5	Pass: Application is submitted successfully and receives a reference ID. Fail: Application is lost, incomplete, or cannot be submitted.	Online loan applications make the loan process accessible and traceable.
#10	Functional	**Loan Application Review:** Loan officers should be able to review submitted loan applications and their relevant details.	Medium	3	Pass: Loan officer can view pending applications and required application details. Fail: Application is missing or the officer cannot review it.	Loan officers need access to application information before making decisions.
#11	Functional	**Loan Approval / Rejection & Status:** Authorized loan officers or managers should be able to approve or reject loan applications, and customers should be able to view the application status.	Medium	5	Pass: Approval or rejection is recorded and the application status is updated correctly. Fail: Decision is not recorded or the displayed status is incorrect.	Clear loan decisions and status tracking keep the lending process transparent.

Issue #	Type	Story Name / Description	Priority	Story Points	Acceptance Criteria	Rationale
#12	Functional	**Transaction History:** Customers should be able to view their transaction history, including deposits, withdrawals, and transfers.	Medium	3	Pass: Transaction history lists the customer's transactions with correct amounts and dates. Fail: Transactions are missing, duplicated, or incorrect.	Transaction history helps customers verify activity and identify errors or unauthorized transactions.
#13	Functional	**Transaction Filtering & Pagination:** Customers should be able to filter and paginate their transaction history to find specific transactions efficiently.	Low	3	Pass: Filters return matching transactions and pagination displays the correct results across pages. Fail: Filters return unrelated transactions or pages contain missing/duplicated records.	Filtering and pagination make large transaction histories easier to search and use.
#14	Functional	**Transaction Statement / Export:** Customers should be able to generate or export a statement containing their transaction information.	Low	5	Pass: Statement contains the selected account and transaction details and can be exported successfully. Fail: Export is unavailable or contains incorrect or missing transactions.	Statements provide customers with a usable record for review and external purposes.
#15	Functional	**Transaction & Loan Notifications:** The system should notify customers about relevant transaction and loan events, such as completed transactions and loan status changes.	Medium	5	Pass: A notification is generated for the configured transaction or loan event. Fail: Required notification is missing or contains incorrect event details.	Timely notifications keep customers informed about important account and loan activity.
#16	Functional	**Beneficiary Management:** Customers should be able to add, view, and manage eligible beneficiary accounts for future fund transfers.	Medium	5	Pass: A beneficiary is added or updated successfully and appears in the customer's beneficiary list. Fail: Invalid beneficiary details are accepted or a saved beneficiary cannot be retrieved.	Managing beneficiaries makes repeated fund transfers easier while keeping transfer destinations organized.
#17	Functional	**Profile and Account settings:** Customers should be able to view and update permitted personal and account-related settings.	Low	3	Pass: Permitted details are updated successfully and the changes are reflected when the customer views their profile. Fail: Unauthorized fields can be changed or valid updates are not saved.	Allowing customers to maintain their permitted information keeps account records current.
#18	Security	**Data security and role access:** All sensitive data, such as passwords and account information, must be encrypted, and access must be controlled by user role.	High	8	Pass: Data is encrypted at rest and in transit; roles only see permitted data. Fail: Sensitive data is readable in plain text, or a role can access data it shouldn't.	A bank is a high-value target, so weak access control or unencrypted data is a serious risk.
#19	Performance	**System Response Time:** The system should respond to common actions, like login or balance checks, within 2-3 seconds under normal load.	Medium	5	Pass: 95% of requests complete within 3 seconds under expected load. Fail: Response times regularly exceed 3 seconds.	Slow response times frustrate customers and make the bank feel unreliable, even if the data is correct.
#20	Availability	**System Availablity and Reliability:** The banking system should remain available and operational for customers and authorized staff during normal operating conditions.	Medium	8	Pass: Core banking functions remain available during expected operating periods and recover from temporary failures. Fail: Frequent outages prevent users from accessing core banking functions.	Banking functions need to be dependable because customers may need access to their accounts and transactions at any time.
#21	Auditability	**Audit Logging:** The system should maintain an audit trail of important account, transaction, loan, and administrative actions.	High	5	Pass: Important actions are recorded with the user, action, date/time, and relevant reference details. Fail: Important actions cannot be traced or audit records can be altered without authorization.	Audit records support accountability, investigation, and verification of banking activities.
#22	Usability	**User Interface and Accessibility:** The system should provide a clear and consistent interface that allows customers and staff to complete common tasks without unnecessary complexity.	Low	5	Pass: Users can complete common tasks using clearly labelled controls and understandable messages. Fail: Important actions are difficult to find or error messages do not explain what went wrong.	A clear interface reduces user errors and makes banking functions easier to use.
#23	Recovery	**Backup and Recovery:** The system should regularly back up critical banking data and support recovery after system or data failures.	Medium	8	Pass: Critical data can be restored from a valid backup within the defined recovery process. Fail: Required banking data cannot be restored after a failure.	Reliable backups reduce the risk of permanent data loss and help the bank recover from failures.
